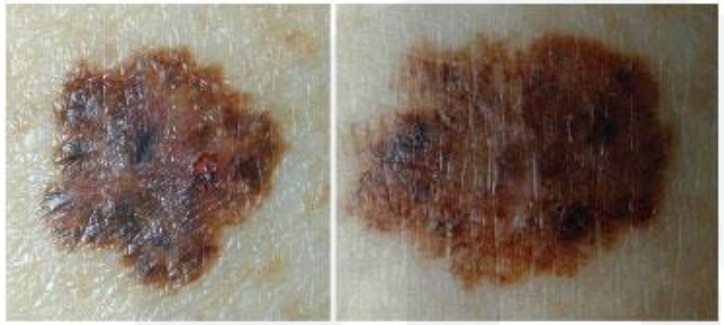
Non-Invasive Detection for Melanoma

Laura K. Ferris, MD, PhD

Professor of Dermatology

University of Pittsburgh

Making biopsy decisions for pigmented lesions



Non-melanoma

Melanoma

How good are we?

- Reader studies:
  - ❖ Sensitivity 65-82%
- NNB: 2.2 – 30.5 (mean 13.2 for US Dermatology practitioners)

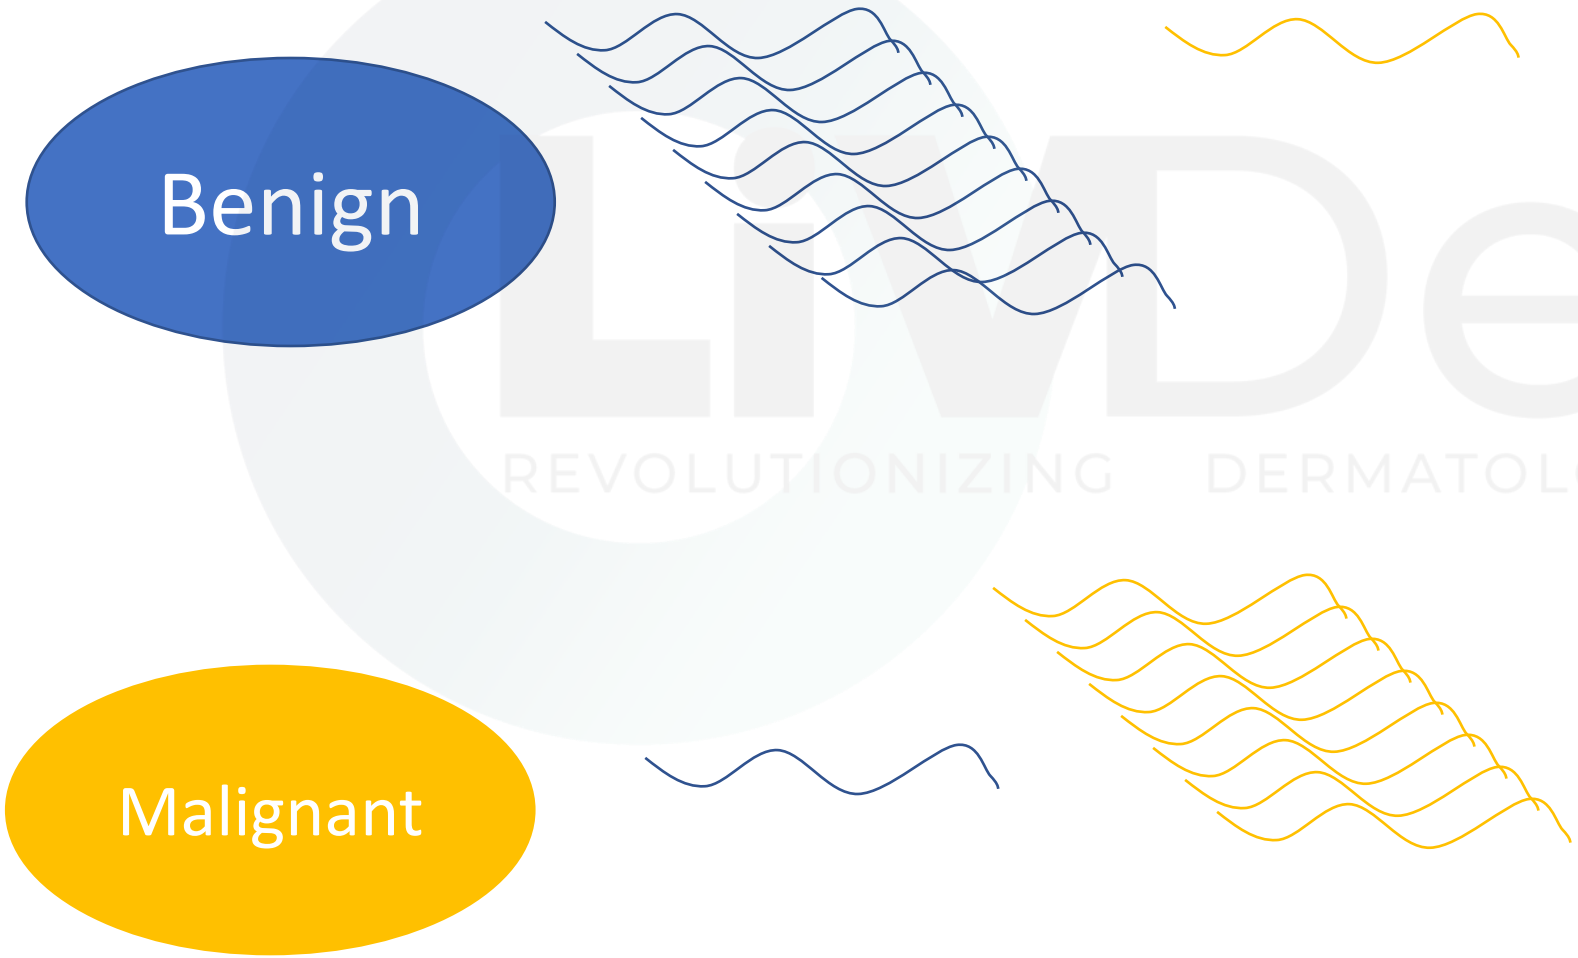
Approaches

Genetic analysis

Physical properties

- Visual
- Conduction

Gene expression profiling (GEP)



Applications in melanoma:

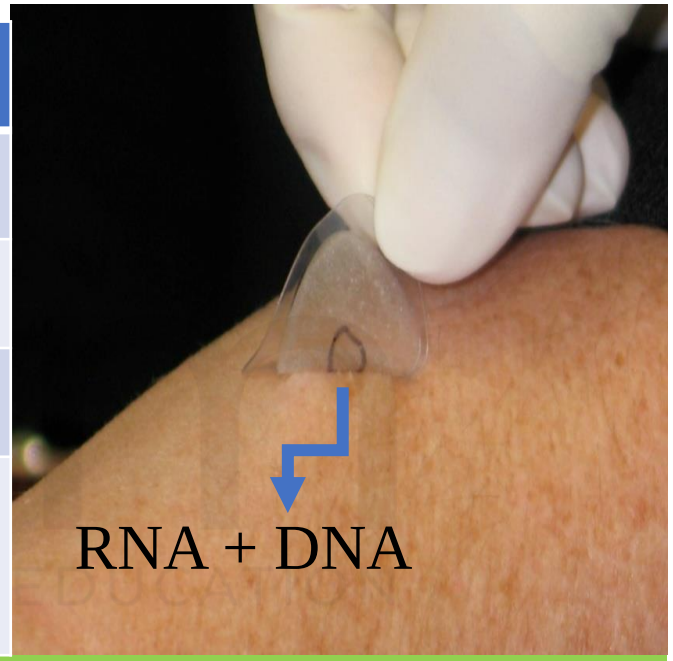
Non-invasive test to help:

1. **Distinguish melanoma from nevi**
2. Classify histologically equivocal biopsied melanocytic lesions
3. Predict which tumors are at highest risk of metastasis

PLA for non-invasive diagnosis of melanoma

J Am Acad Dermatol 2017;76:114-20.
JAMA Dermatol. 2017 Jul 1;153(7):675-680

Genetic finding	% histologic melanoma
LINC (RNA) +	7%
PRAME (RNA) +	50%
LINC ***and*** PRAME (RNA) +	93%
TERT promoter mutation (DNA) present	79%



SENSITIVITY:

- 97% of melanomas express LINC, PRAME, and/or TERT

SPECIFICITY:

- 48% of non-melanomas are negative for LINC, PRAME *AND* TERT

Utility of *TERT* promoter mutations for cutaneous primary melanoma diagnosis

Nancy E. Thomas, MD, PhD[*,†], Sharon N. Edmiston, BS[*,†], Yihsuan S. Tsai, PhD[†], Joel S. Parker, PhD[†,‡], Paul B. Googe, MD[*,§], Klaus J. Busam, MD[¶], Glynis A. Scott, MD[‖,**], Daniel C. Zedek, MD[*,§], Eloise A. Parrish, MS[†], Honglin Hao[*], Nathaniel A. Slater, MD[*], Michelle V. Pearlstein, MD[*], Jill S. Frank, MS[†,††], Pei Fen Kuan, PhD[‡‡], David W. Ollila, MD[†,††], and Kathleen Conway, PhD[*,†,§§]

- *TERT* (telomerase reverse transcriptase) – maintains telomeres; mutations lead to uncontrolled replication and proliferation of cancer cells

- *TERT* promotor mutations identified in:
  - 67/87 (77.9%) melanomas
  - 1/72 (1.4%) nevi

Lower rates of TERT positivity in:
- Acral melanoma
- Non-white race
- Younger patients
- Non-sun damaged skin
- Lower extremity lesions

Am J Dermatopathol. 2019 April ; 41(4): 264–272.

Dermatol Online J. 2019 May 15;25(5).

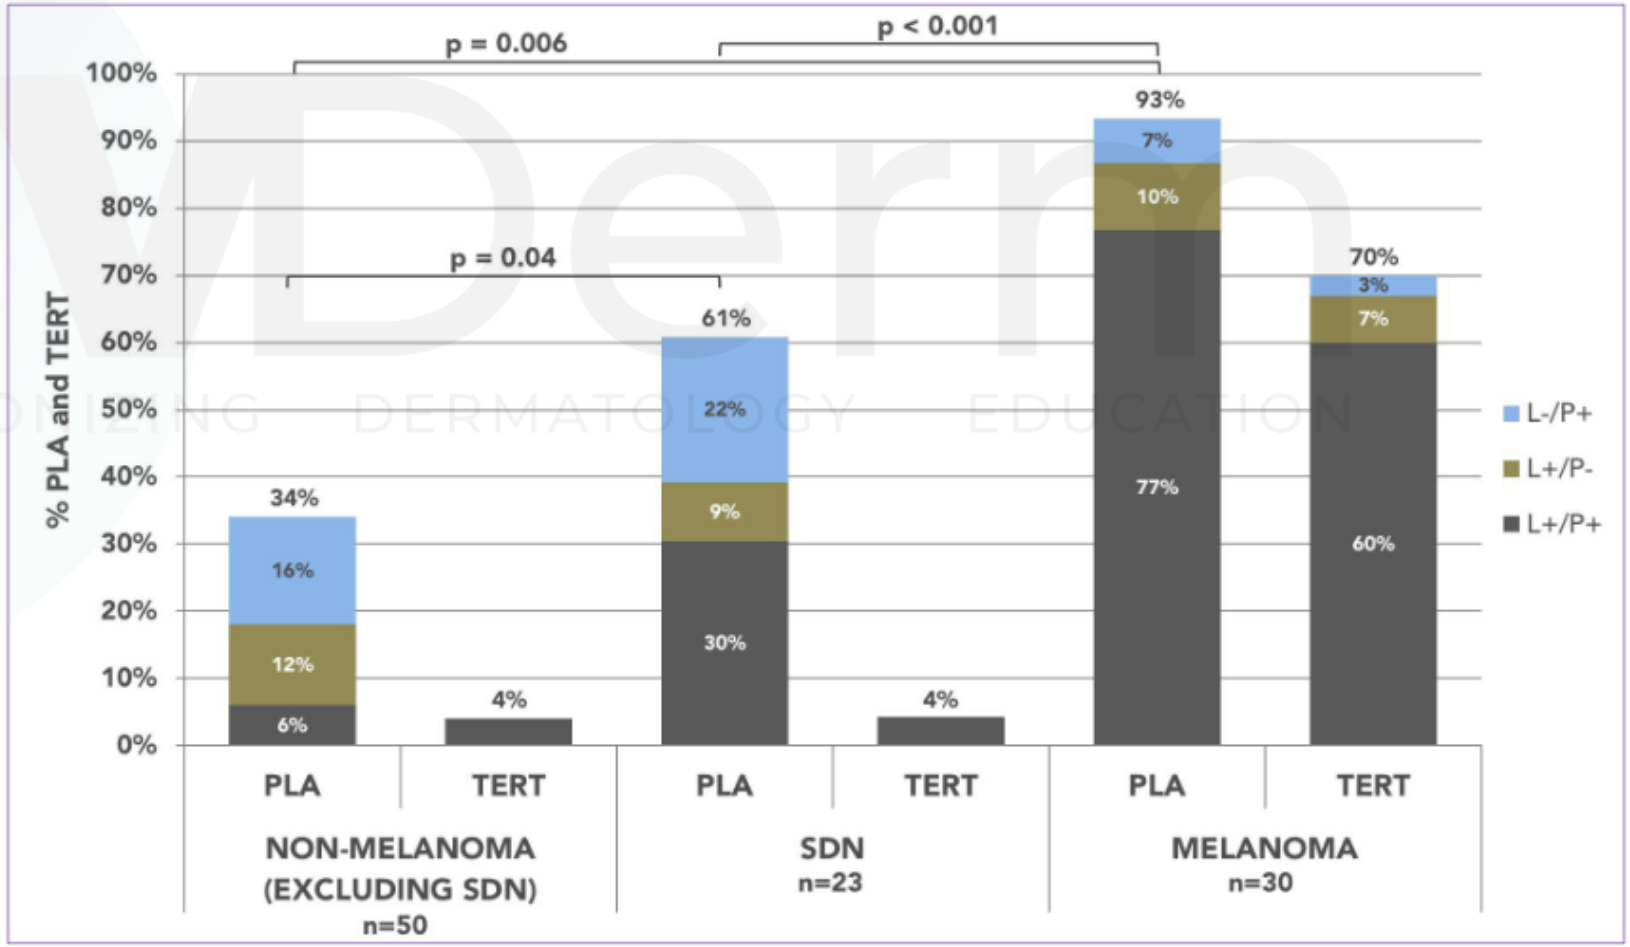
Risk Stratification of Severely Dysplastic Nevi by Non-Invasively Obtained Gene Expression and Mutation Analyses (SKIN, March 2020)

Severely dysplastic nevi:

- Commonly express LINC and/or PRAME
- *Rarely* carry TERT promoter mutation

Melanoma

- Most express LINC and/or PRAME *AND* TERT promoter mutation



What about negative PLA lesions?

- 1781 PLA negative patients
  - Clinical follow up on 69%
  - 10 (0.8%) diagnosed in next ~ 1 yr with melanoma (in situ, stage I)

- 304 PLA negative patients, retested 6-12 mo later
  - 34 (11%) were PLA positive, all biopsied
  - 3 (1%) melanomas (all in situ)

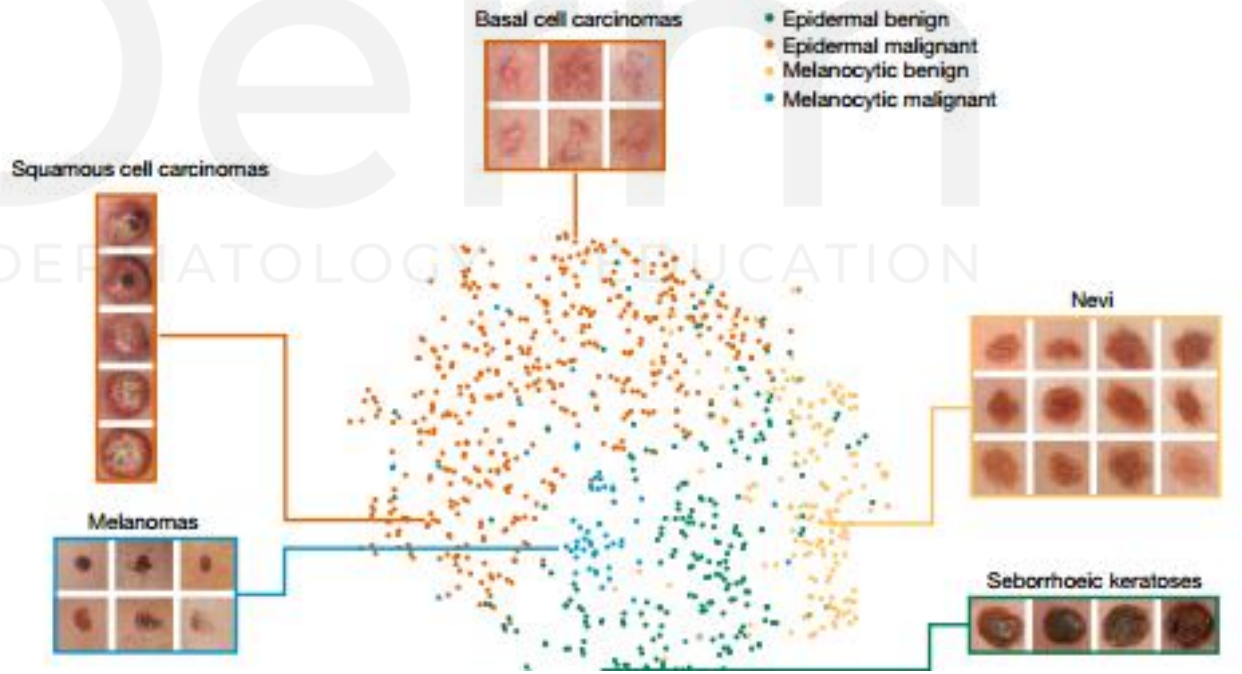
Negative predictive value >99%

SKIN The Journal of Cutaneous Medicine, September 2021

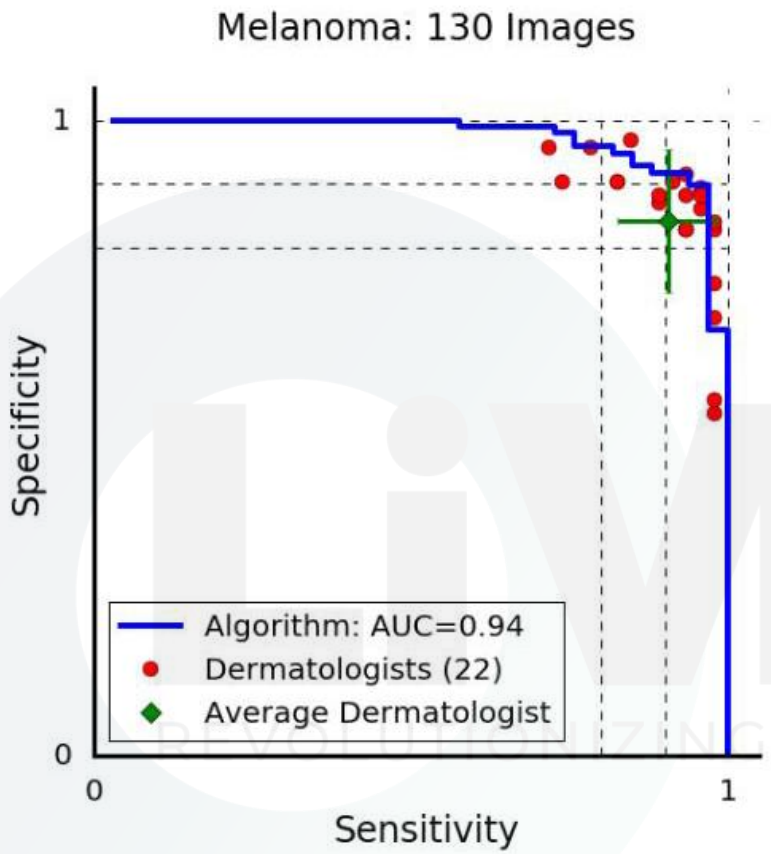
Dermatologist-level classification of skin cancer with deep neural networks

- Trained on >100,000 skin lesion images of >2,000 diseases
- Compared accuracy to dermatologists
  - Melanoma vs nevi
  - BCC / SCC vs SK
  - NOT SK vs melanoma!

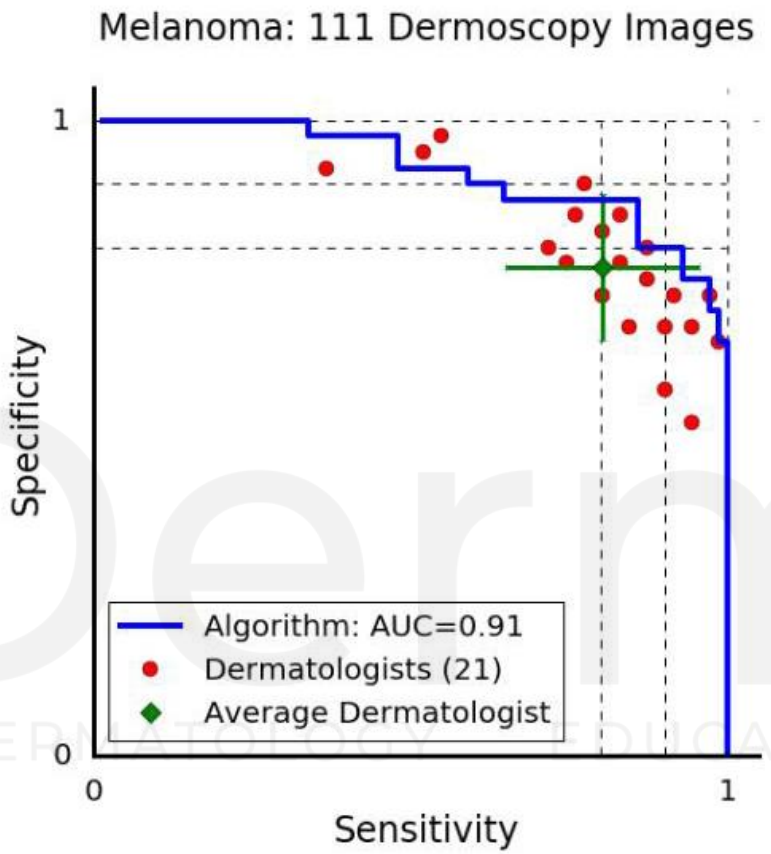
Clinical or dermatoscopic images



Nature. 2017 Feb 2;542(7639):115-118.



33 melanomas, 97 benign nevi



71 melanomas, 40 benign nevi

Red dot above the curve = Dermatologist outperformed computer

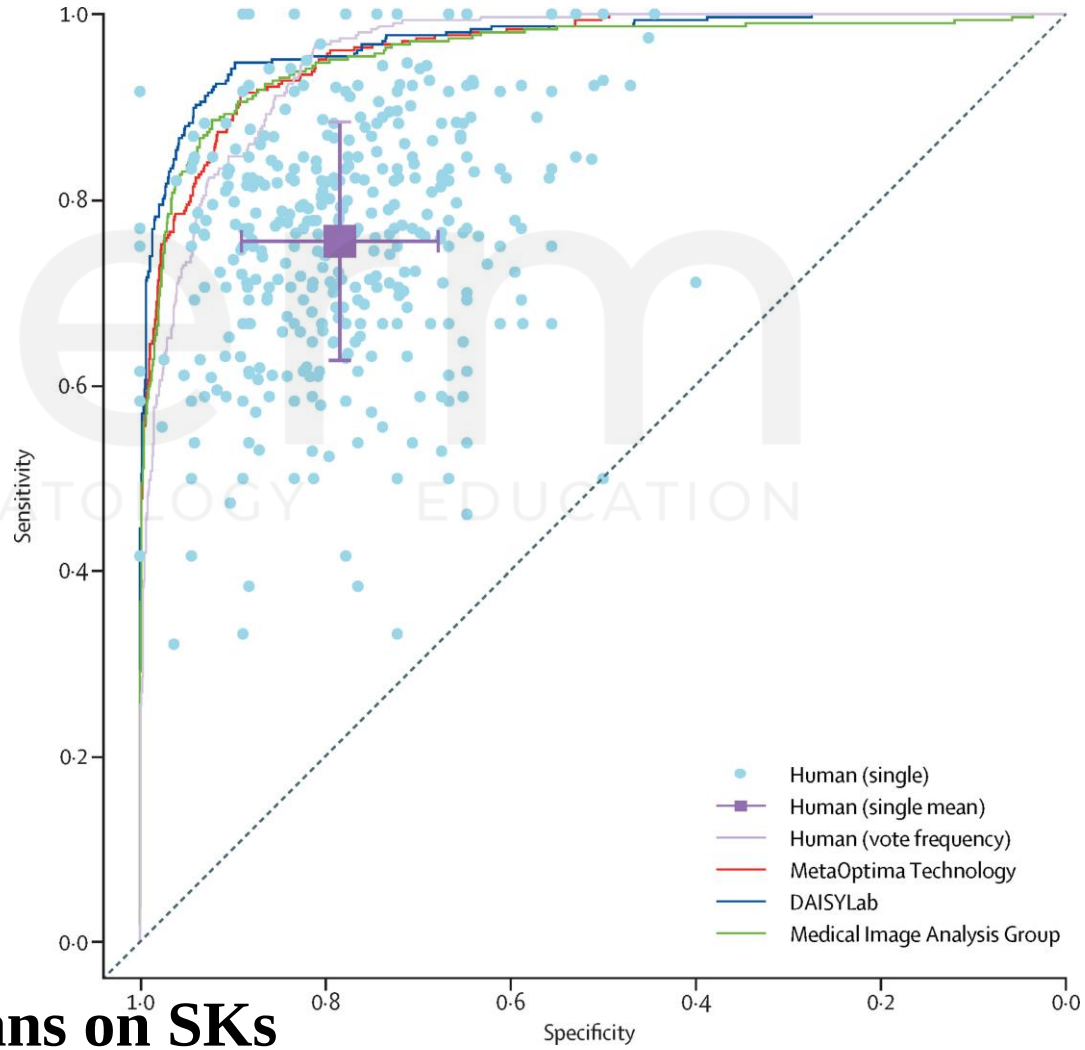
Red dot below the curve = Computer outperformed the dermatologist

No data on lesion thickness

Nature. 2017 Feb 2;542(7639):115-118.

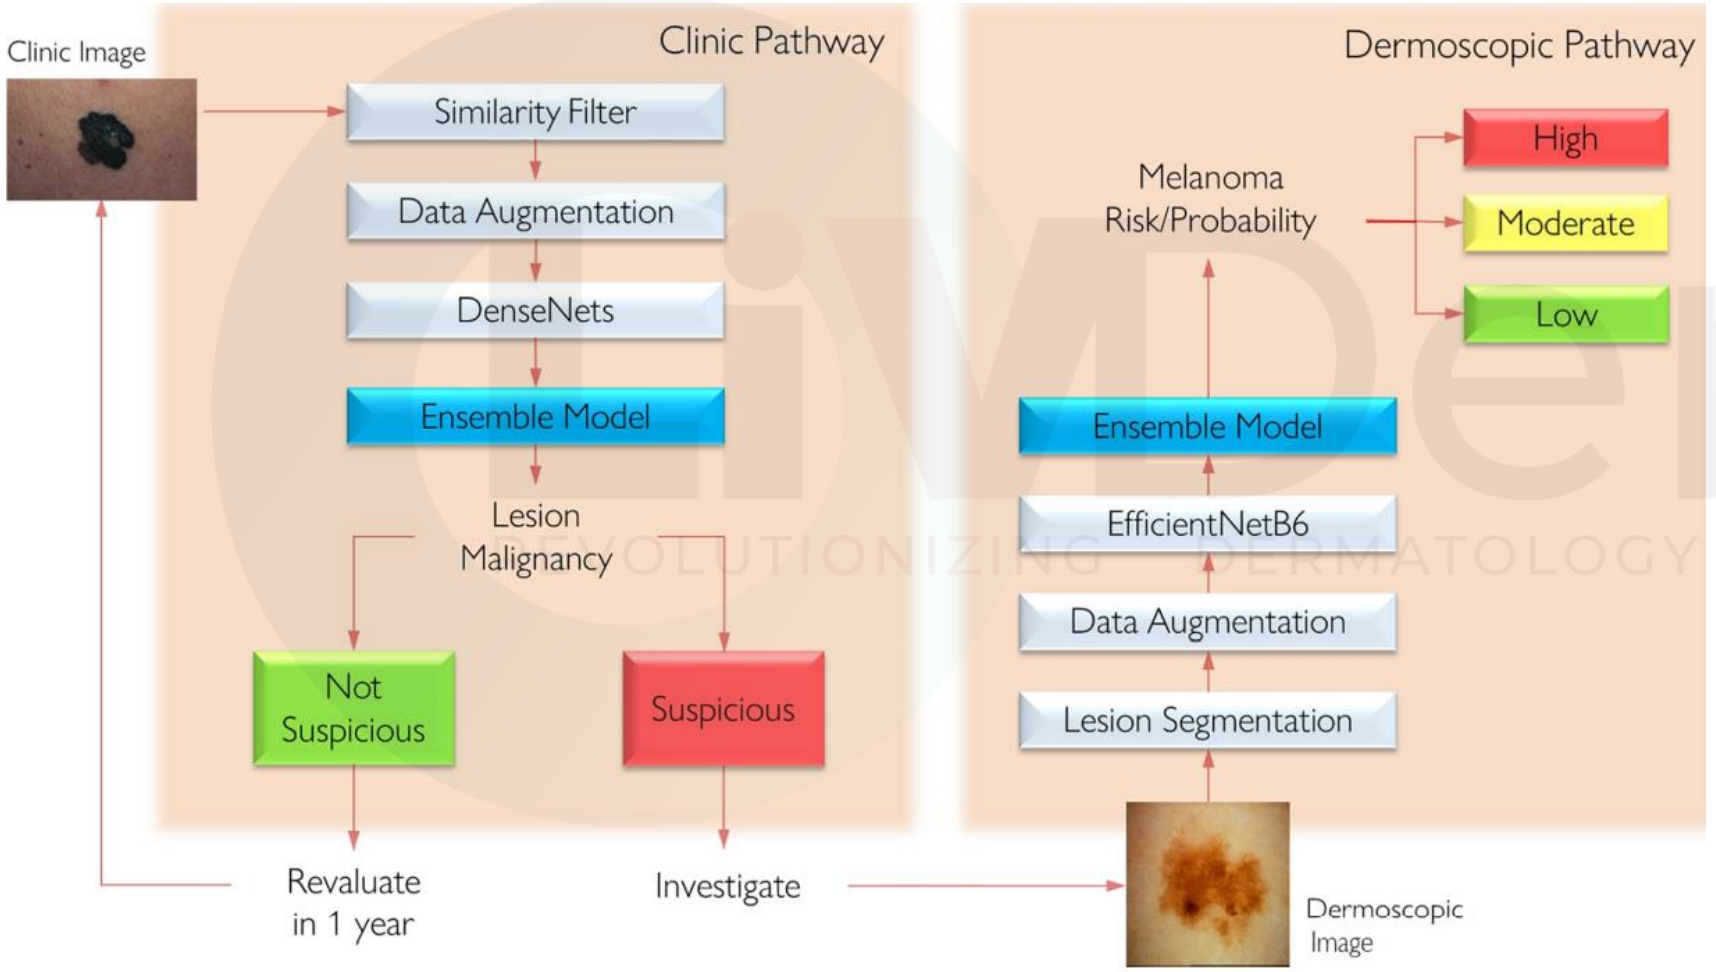
Discrimination of malignant from benign pigmented skin lesion

	Sensitivity	Specificity	Negative predictive value	Positive predictive value
All human readers (n=511)				
Melanoma	73·1% (65·8–79·6)	92·8% (91·3–94·2)	96·4% (95·3–97·4)	56·6% (49·7–63·2)
Expert readers (n=27)				
Melanoma	67·8% (60·3–74·8)	94·0% (92·5–95·2)	95·8% (94·6–96·8)	58·9% (51·7–65·8)
All algorithms (n=139)				
Melanoma	67·3% (59·7–74·2)	97·0% (96·0–97·9)	95·9% (94·7–96·9)	74·2% (66·6–80·9)
Top three algorithms (n=3)				
Melanoma	81·9% (75·4–87·3)	96·2% (95·1–97·2)	97·6% (96·7–98·4)	73·6% (66·9–79·6)



Top 3 algorithms also performed equivalent to humans on SKs

AI for melanoma diagnosis in primary care- the future?



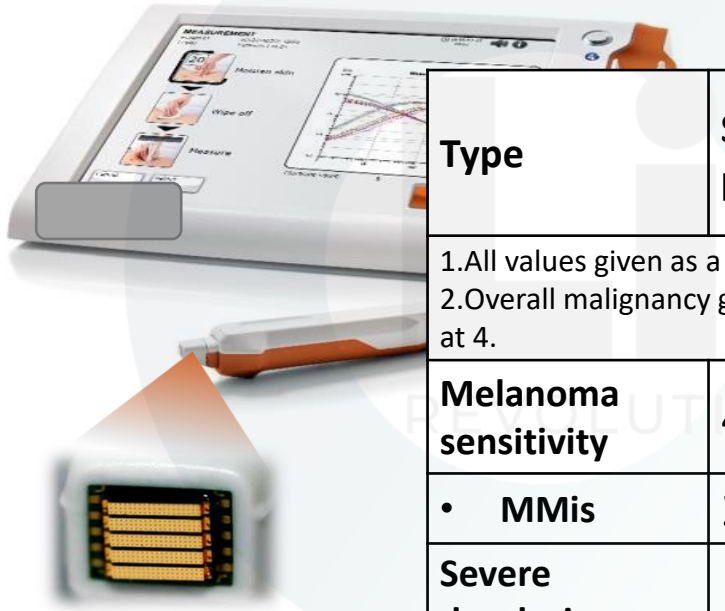
Trained using database of available and generated clinical and dermatoscopic images

- Sensitivity : 90%
- Specificity: 85-89%
- PPV: 59-65%
- NPV: 97%

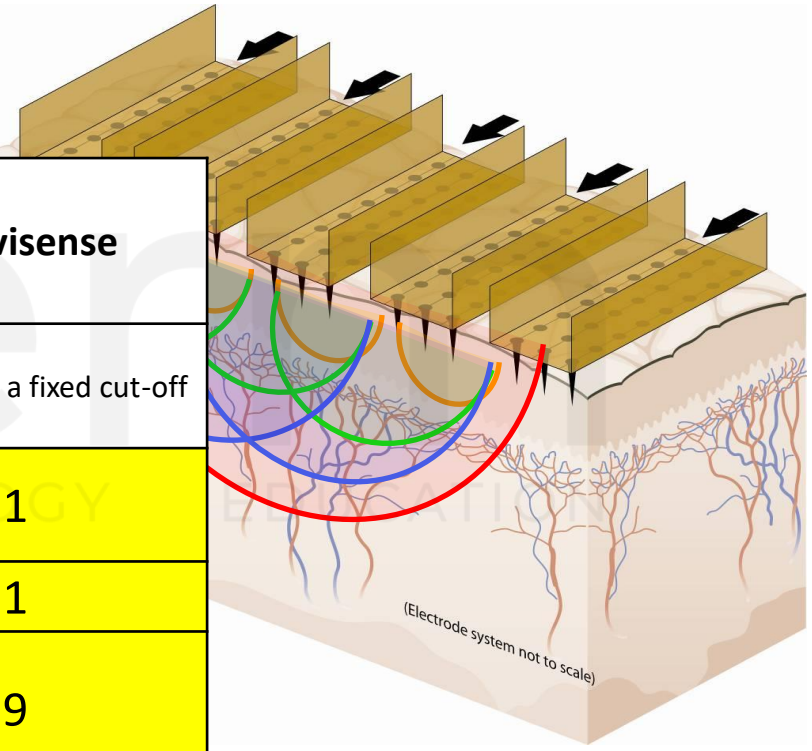
CAD system pathways developed to provide outputs for clinical and dermoscopy images to primary care physicians.

PLOS ONE | September 22, 2021

Electrical Impedance Spectroscopy (EIS)
FDA approved 2017 for use by dermatologists



Type	Seven-point	Malignancy grading	Local pathology	Nevisense
1.All values given as a percentage. NA, not applicable. 2.Overall malignancy grading as determined by the visual classification board with a fixed cut-off at 4.				
Melanoma sensitivity	49·2	70·6	84·5	97·1
• **MMis**	28·7	55·4	73·3	94·1
Severe dysplasia sensitivity	12·1	38·3	NA	83·9
Overall specificity	94·2	81·4	98·0	35·8



Br J Dermatol. 2014. Nov;171(5):1099-107.
FDA report.

NOTE: sensitivity 57.1% in patients <30 years of age (small n)

MELAFIND- What can we learn?

- Sensitivity comes at the cost of specificity
- Limited utility: Recommends biopsy of about 90% of lesions
- Extremely expensive optics/ machine
- Fixed classifier- cannot "learn" in real time →need FDA reapproval
- Product no longer available / supported

	Sensitivity	Specificity
MelaFind	97%	9%
Readers	72%	51%

Threshold	Sensitivity (95% CI)	Specificity (95% CI)
≥ -3	100.0% (97.9-100%)	0.8% (0.4-1.4%)
≥ -2	99.4% (96.9-100%)	1.3% (0.8-2.0%)
≥ -1	98.9% (95.9-99.9%)	3.6% (2.7-4.7%)
≥ 0	98.3% (95.1-99.6%)	10.8% (9.2-12.5%)
≥ 1	93.1% (88.3-96.4%)	29.8% (27.4-32.2%)
≥ 2	75.4% (78.4-81.6%)	60.0% (57.4-62.5%)
≥ 3	54.3% (46.6-61.8%)	81.8% (79.7-83.8%)
≥ 4	30.9% (24.1-38.3%)	91.4% (89.9-92.8%)
≥ 5	15.4% (10.4-21.7%)	96.1% (95.0-97.0%)
≥ 6	7.4% (4.0-12.4%)	98.8% (98.2-99.4%)

Monheit et al, Arch Dermatol. 2011 Feb;147(2):188-94. MelaFind Package insert

Human vs Machine – key differences in determining if a lesion is benign or malignant

Parameter	Human	Machine
Context	Consider all lesions on the skin, patient history, risk factors	Lesion in isolation; only the lesion the user chooses to evaluate
Objectivity	• Shaded by experience, fear of missing melanoma, incentive to biopsy or not • Favor biopsy of benign over missing malignant	• Objective • Can choose to maximize sensitivity vs. specificity
Learning	Years: one patient / paper/ textbook at a time	Can train classifier in hours / days
Features evaluated	• Uses set criteria to evaluate a lesion • Can usually explain "why"	• Can identify and use new features and process large amounts and layers of data • Cannot always explain "why"

Sensitivity and specificity are just one factor: must consider how tools designed to improve melanoma detection should best be integrated into clinical practice!
